

Tattoo Removal

Do you have tattoo regrets? Industry experts estimate that 1 of every 4 people with a tattoo have thought about removal options. In the past, tattoo removal was painful with inconsistent results and often left visible scarring. Using the newest Q-Switched Laser technology we provide safe and effective tattoo removal leaving natural looking skin. Our laser tattoo removal can be used to completely remove a tattoo or partially remove/lighten a tattoo.

The Q-Switched Laser delivers high energy light pulses that are absorbed by the tattoo. These pulses break down the pigment into tiny particles that your body naturally absorbs and eliminates. While we know that once the decision has been made to remove your tattoo it is common to want it gone immediately, laser tattoo removal is a gradual process. The number of treatments needed will depend on your tattoo's location, density, depth, and ink colors. The Q-Switched Laser works best on blue, black, blue/black, red, green, and yellow inks. Black ink is the easiest to target while colored inks can be a bit more complicated.

Is tattoo removal painful? While pain tolerance varies from person to person, most people find the procedure uncomfortable but totally tolerable. Many describe the treatment as a rubber band snap to the skin. Although no anesthesia is required, you will be provided with a cooling device during the treatment. The number of laser pulses needed will depend on the tattoo's size, but most sessions last only a few minutes.

After the treatment is over, the after-care process begins immediately. Your provider will give you specific post treatment instructions. While your skin may be slightly red immediately following the procedure, this should resolve within a few hours.
